

LogWatch

Operational Intelligence Tool!

LogWatch can monitor, analyze, and report on data produced by NonStop applications and systems software

LogWatch monitors log files to give you realtime situation detection. LogWatch is a Guardian program that “watches”, log files for new entries. LogWatch captures log records, looks for configurable patterns, and generates alerts. LogWatch is a perfect companion tool to your Performance Monitoring tools like MOMI or Prognosis.

Give your EMS and VHS logs a break!

LogWatch complements your monitor tools because it lets you monitor your application logs easily without having to set up complex EMS filters or SPI rules. Find out many other features of LogWatch, and how it can help you achieve Operational Intelligence

TIC Software

How Logwatch Works?

- Configured to monitor any types of files– Guardian or OSS – for any error conditions.
- Detects errors in log files when they happen and raises alert immediately before problem escalates and affects user.
- Rules can be set up easily and quickly

Out-of-the-box solution for monitoring OSS files

If you are running OSS applications like iTP Web Server, Java, MQ, NS SOAP and others, then you will appreciate how LogWatch can help you monitor those log files easily.

LogWatch can be configured to monitor those log files and raise alerts, without having to burden your Operation team to learn how to access OSS or navigate through its myriad of utilities. It is like plug-and-play.

Key Features

- Monitors log files and raise alerts Automatically
- Monitor OSS files easily
- Scan mode allows for offline analysis
- Multiple line events
- "No Activity" detection
- Monitors EMS and VHS Log without writing filters
- Easy to install and to use

LogWatch consolidates and centralizes application logging

Many applications are made up of multiple requesters, servers and external interfaces. Each component may write a separate entry into a different log file. LogWatch allows you to monitor these entries in different log files and consolidate them into a single central log file for easy trouble-shooting.

About TIC Software

TIC Software was created to address the challenges of keeping HPE NonStop legacy systems current with ever-evolving "modernization" technology -providing consulting expertise and software solutions designed to keep mission-critical applications up-and-running. Today, we continue to meet the modernization challenges as well as offer migration solutions to organizations looking to explore other technological options.
